

Title of course: **Essential Terminology for Neuroscience, Neurology, and Behavioural Biology Through Case Studies**

Lecturer: dr Maciej Golan

Teaching language: English Course description: The classes

The most significant scientific innovations are published in English-language journals, and most discoveries are communicated internationally through English-speaking channels. To stay up to date with scientific progress and effectively share important research on a global scale, one must have a strong grasp of the conceptual framework of brain sciences and be able to navigate it confidently.

This course introduces key concepts and essential vocabulary in neuroscience, neurology, neuropsychology, social neuroscience, and behavioural biology. These topics will be explored in a practical context through real-life scientific papers, news articles, and various forms of data presentation. Each lecture will conclude with a summary of the key terms and concepts covered.

The course is delivered entirely in English, including all explanations and definitions.
